The objectives of the European Green Deal and the Farm to Fork Strategy support the growth of entire organic food sector in the EU. The companies processing organic food need in-depth knowledge of the legal requirements of organic production and food safety. The university's lecturers face a situation where current study programmes and teaching materials do not always take into account the requirements of organic processing.

SAFE-ORGfood project supports cooperation between 5 European universities to develop, implement and disseminate innovative, comprehensive teaching materials on food safety in organic food production, which will improve the quality and efficiency of teaching at the university. The project will provide:

- analysis of the food safety knowledge among the organic food producers;
- handbook – theory about food safety in organic production;
- ready-to-implement manuals with practical solutions about food safety;
- e-learning materials on organic foods safety for master and postgraduate studies;
- on-line lectures (videos) on food safety system in organic production.

Acknowledgments: This project was supported by the Erasmus+ Programme of the European Union and by the Estonian Ministry of Education and Research programme „Support for research and development on resource valorisation“ ResTA28.
